                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      virucide, antiparasitic, cytostatic, antirheumatic, antiarthritic, neuroprotective, antimicrobial and antiallergic activities. These oligodeoxynucleotides have immunopharmacological activity and induce synergistic antigen specific immune response of an immunopotentiating cytokine. This oligonucleotide sequence is a immunostimulatory dI/dU containing ODN taken from table 1 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligodeoxynucleic acid molecules (ODNs) that contain deoxyinosine (dI) deoxyuridine (dU). Specifically, it refers to ODN molecules that encode antigenic proteins, yet do not induce the systemic production of pro-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of an immunostimulatory oligodeoxynucleic acid molecule in the preparation of pharmaceutical composition for treating e.g. systemic lupus erythematosus, sepsis or viral infections.
                                                                                                                                              Synthetic

This invention relates to a novel use of immunostimulatory
CC oligodeoxymucleic acid molecules (DNNs) that contain deoxyinosine (dI) or
CC deoxyuridine (dU). Specifically, it refers to DNN molecules that encode
CC antigenic protesins, yet do not induce the systemic production of pro-
CC inflammatory cytokines such as TNF-alpha and interleukin-6 (IL-6), thus
CC reducing the induction of potential harmful side effects. The present
CC invention describes compositions that are useful for preparing a
CC pharmaceutical composition that can activate dendritic cells, B cells,
CC puthermore, they can be used to treat an immune system deficiency.
CC Furthermore, they can be used to treat an immune system deficiency.
CC mysathenia gravis, immunodeficiency disorders such as AIDS, malignant
CC mysathenia gravis, immunodeficiency disorders such as AIDS, malignant
CC dermatological, immunosuppressive, antisflammatory, antibacteria,
CC viruses and protozoa. Accordingly, such compositions exhibit
CC dermatological, immunosuppressive, antisflammatory, antibacterial,
CC viruses and protozoa. Accordingly, such compositions exhibit
CC dermatological, immunosuppressive, antisflammatory, antibacterial,
CC viruses and protozoa. Accordingly, such compositions exhibit
CC dermatological, immunosuppressive, antisflammatory, antibacterial,
CC onigodeoxymucleotides have immunopharmacological activities. These
CC oligodeoxymucleotides have immunopharmacological activity and induce a
CC synergistic antigen specific immune response of an immunopotentiating
CC containing ODN of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

                                                                                                                               The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or call differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or
                                        treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
